DAYLIGHT LIGHTING
SYSTEMS

Daylight natural lighting systems are products that minimize the need for the use of electrical lighting (artificial lighting) during daytime by bringing daylight to spaces with zero energy. Thus, energy costs arising from artificial lighting are reduced and carbon emissions are reduced.

These are the systems that provide a natural homogeneous lighting environment by distributing the rays transferred to the channels with a special transparent dome system placed on the roof. It has been the pioneer of systems that meet the natural lighting needs in residential and commercial areas due to its energy saving, nature-friendly design and increase in working efficiency.
